Explanation: When two quantities vary inversely, their products are always equal to a constant, which we can call k. If the square of x and the cube of y vary inversely, this means that the product of the square of x and the cube of y will equal k. We can represent the square of x as x^2 and the cube of y as y^3 .

It could be y is equal to $1/x$. It could be y is equal to 2 times $1/x$, which is clearly the same thing as $2/x$. It could be y is equal to $1/3$ times $1/x$, which is the same thing as 1 over $3x$. it could be y is equal to negative 2 over x. And let's explore this, the inverse variation, the same way that we explored the direct variation.
