### Algorithms and Programming: Problems and Solutions ...

Algorithms are a series of steps used to solve a problem, and you shouldn't confuse them with other entities, such as equations. An algorithm is never a solution in search of a problem. No one would create a series of steps to solve a problem that doesn't yet exist (or may never exist).

What is an algorithm in a programming perspective? You see, computer basically does a lot of math which means it has a lot of problems to solve. That's exactly why algorithms form the heart of computer science. A computer algorithm is a computational procedure that takes in a set of finite input and transforms it into output by applying some math & logic.

### Algorithms And Programming Problems Solutions

Algorithms describe the solution to a problem in terms of the data needed to represent the problem instance and the set of steps necessary to produce the intended result. Programming languages must provide a notational way to represent both the process and the data. To this end, languages provide control constructs and data types.

We took a specific problem we wanted to solve, taking images and applying the green screen technique to them. And worked through step-by-step how to go from that problem statement to a working piece of code. Now, what we're going to do in this lesson is we're going to take a closer look at solving programming problems.
