determination of the freezing point of milk uses a thermistor cryoscope, in which a thermostatically controlled device is cooled and a thermistor probe is used for the measurement of the freezing point. This reference method requires the use of plateau-timed instruments.

...
The freezing point is the temperature at which the liquid changes to a solid. At a given temperature, if a substance is added to a solvent (such as water), the solute-solvent interactions prevent the solvent from going into the solid phase.

Boiling Point ...

Freezing point depression is a colligative property observed in solutions that results from the introduction of solute molecules to a solvent. The freezing points of solutions are all lower than that of the pure solvent and is directly proportional to the molality of the solute.

$$\Delta T_f = T_f(\text{solvent}) - T_f$$

Solution Of Different
Composition

The freezing point is the temperature at which a liquid changes into a solid. The temperature stays at this point until all the liquid changes state. For example, water freezes at 0 degrees C/32 degrees F at the standard atmospheric pressure (sea level). Freezing point doesn't get affected by changes in pressure, unlike boiling point.
