Physical Science and Technology (Third Edition), 2003. IX.C.2.a Design. The magnetomotive force, expressed in ampere-turns, is a measure of the capability of the field winding. The total cross-section area in each slot available for copper is subdivided into turns, all of which are connected in series to form a "coil."

The Bourdon gage, shown in Fig. 2.7, works on the principle that pressure in a curved tube will tend to straighten it. Thus, as shown in the figure, pressure acts equally on every square inch area in the tube, 1. Since the surface  $S_1$  on

But there's another reason too.

Industrial plants have huge factory machines that are much bigger and more energy-hungry than anything you have at home. The energy an appliance uses is directly related (proportional) to the voltage it uses. So, instead of running on 110-250 volts, power-hungry machines might use 10,000-30,000
