Developmental changes during adulthood is an even more recent area of study. This is mainly due to advances in medical science, enabling people to live to old age. Charles Darwin is credited with conducting the first systematic study of developmental psychology. In 1877 he published a short paper detailing the development of innate forms of communication based on scientific observations of his infant son, Doddy.

Developmental psychology is the scientific study of how and why human beings change over the course of their life. Originally concerned with infants and prepubescent children, the field has expanded to include adolescence, adult development, aging, and the entire lifespan. Developmental psychologists aim to explain how thinking, feeling, and behaviors change throughout life.
