Markov Processes For Stochastic Modeling

A Markov point process is a stochastic process that enables interactions between points in a point process. Markov point processes are used to model many applications that include earthquakes, raindrop-size distributions, image analysis, option pricing, and ecological and forestry studies.

Historical aside on stochastic processes. Andrei Andreevich Markov (1856-1922) was a Russian mathematician who came up with the most widely used formalism and much of the theory for stochastic processes.. A passionate pedagogue, he was a strong proponent of problem-solving over seminar-style lectures.

Introduction to stochastic processes: Markov Chains

A Markov Process is defined as a stochastic sequence of events in which the likelihood of the next state only depends on the current state rather than past or future states . In this case, we defined each state to be the specific symptoms that a patient has experienced, and each transition is only dependent on these symptoms.

In probability theory, a Markov model is a stochastic model used to model randomly changing systems. It is assumed that future states depend only on the current state, not on the events that occurred before it (that is, it assumes the Markov property). Generally, this assumption enables reasoning and computation with the model that would otherwise be intractable.

An Introduction to Markov Modeling: Concepts and Uses Kharkov modeling is a modeling technique that is widely useful for dependability analysis of complex fault tolerant systems. It is very flexible in the type of systems and system behavior it can model. It is not, however, the most appropriate modeling technique for every modeling situation.

Hidden Markov Model (HMM) is a statistical Markov model in which the system being modeled is assumed to be a Markov process – call it – with unobservable ("hidden") states. HMM assumes that there is another process whose behavior "depends" on . The goal is to learn about by observing . HMM stipulates that, for each time instance , the conditional probability distribution of given the history ...
