A standardized interface for thread implementation is POSIX Threads (Pthreads), which is a set of C-function library calls. OS vendors are free to implement the interface as desired, but the application developer should be able to use the same interface across multiple platforms.

A programming model  
refers to the style of  
programming where  
execution is invoked by  
making what appear to  
be library calls.

Examples include the POSIX Threads library and Hadoop's MapReduce. In both cases, the execution model is different from that of the base language in which the code is written. For example, the C programming language has no execution model for input/output or thread behavior.
