The “theory of relativity ” (or simply “relativity ”) generally refers to two theories of Albert Einstein, his Special Theory of Relativity (or simply special relativity) of 1905, and his General Theory of Relativity (or general relativity) of 1916. Along with quantum theory, relativity is one of the two main planks on which almost the whole of

Because Isaac Newton's law of gravity served so well in explaining the behaviour of the solar system, the question arises why it was necessary to develop a new theory of gravity. The answer is that Newton's theory violates special relativity, for it requires an unspecified "action at a distance" through which any two objects—such as

the metric coefficients  $\{g_{tt}\}$  and  $\{g_{xx}\}$  converge back to 1, and we say that the space is "flat," giving us once again special relativity. Of course the "hard part" of general relativity is determining how the metric coefficients arise from what we already know is the source of gravity - mass-energy.

The general theory of relativity couldn't have happened without an earlier theory. The theory of relativity that Einstein put forth in 1905—which is now known as the special theory of relativity—describes how lengths in space and durations of time are different to observers moving at different speeds, in different frames of reference.
