River ecosystems are flowing waters that drain the landscape, and include the biotic interactions amongst plants, animals and micro-organisms, as well as abiotic physical and chemical interactions of its many parts. River ecosystems are part of larger watershed networks or catchments, where smaller headwater streams drain into mid-size streams, which progressively drain into larger river networks. River ecosystems are prime examples of lotic ecosystems. Lotic refers to flowing water, from the La

Ecology is the study of living things and their habitats. In the case of stream ecology, scientists are often concerned with the organisms – such as plants, animals, and bacteria – that live in and on the water as well as the larger organisms that depend on the health of the water for their wellbeing.

Ecology is the scientific study of the interactions between organisms and their environment (including other organisms); therefore, stream ecology encompasses the full field of ecology using flowing waters as the system of study. A stream is the broad term applied to running waters of all sorts; streams may also be named rivers, creeks, brooks, etc., according to the size of the stream.

Stream ecology is the study of all the living and non-living components of stream systems and how those elements interact with each other. Think of anything you might find in a stream: a trout, a crayfish, a rock, a bug, maybe even an old tire.

### Stream Ecology Institute - Susquehanna University

I am interested in both basic and applied research in stream ecology. My lab seeks to understand how ecological processes like dispersal function and how they affect the structure and health of populations and communities in rivers. I am also interested in the impact of invasive species and human activities on stream ecosystems.

Methods in Stream Ecology provides a complete series of field and laboratory protocols in stream ecology that are ideal for teaching or conducting research. This two part new edition is updated to reflect recent advances in the technology associated with ecological assessment of streams, including remote sensing.

### Methods in Stream Ecology, Volume 1 | ScienceDirect

Damming rivers changes their ecology forever. Each stream has its own biological community, all members interacting with each other in a complex fashion, all depending on each other for their survival. Dams (by changing flows, temperatures, and water clarity) change those communities. Habitats are removed.
