The Dynamics Of Aggression Biological

Aggression usually involves a sequence of behaviors, reflecting escalations and de-escalations in the form or intensity of the actions taken, which play out over time. This book provides a context in which social and biological research on the aggressive behaviors of human and non-human subjects, interacting in dyads or groups, can be compared and integrated.

The Dynamics of Aggression | Taylor & Francis Group

This volume provides a context in which social and biological research on the aggressive behaviours of human and non-human subjects can be compared and integrated. Three basic interpretations of aggression dynamics emerge: economic; psychological process; and emergent process. (source: Nielsen Book Data)

While there are many biological factors associated with aggression, their predictive value remains still quite low. The first hurdle in researching aggression is how to define it. It is an easier task with animals, who tend to display stereotyped patterns of violence such as killing to gain food or territory.

The Biological Basis of Aggression - Brain Connection

The Role of Biology in Aggression Aggression is controlled in large part by the area in the older part of the brain known as the amygdala (Figure 9.5. "Key Brain Structures Involved in Regulating and Inhibiting Aggression"). The amygdala is a brain region responsible for regulating our perceptions of, and reactions to, aggression and fear.

Aggression is behavior which causes intentional harm to another person (Anderson, 2002). More specifically, aggression is defined as "any sequence of behavior, the goal response to which is the injury of the person toward whom it is directed" (Dollard et al.,1939).

Causes of Aggression: A Psychological Perspective | Owlcation

Editor Bios. Overview. Overview. Violence and aggression have existed as long as mankind, and the need to understand and control these forces has only continued to grow throughout history. Thanks to the advance of psychological research within the social and behavioral sciences, as well as several other scientific disciplines, we have more knowledge than ever before about the genetic, developmental, interpersonal, and cultural causes of aggression.

Many biological and neural systems can be seen as networks of interacting periodic processes. Importantly, their functionality, i.e., whether these networks can perform their function or not, depends on the emerging collective dynamics of the network. Synchrony of oscillations is one of the most prominent examples of such collective behavior and has been associated both with function and ...

The precise relationship between the id, ego, and instinctual drives remains an issue of dispute. The most prominent post-Freudian position proposes that the ego is independent of the instinctual drives (e.g., Hartmann, 1950, 1958).However, an alternative, albeit less-recognized, school of thought proposes instead that it is the instinctual drives as knowers that constitute the ego.

Biological models are usually described using difference equations. As a result, we are - in this work - interested in studying a general difference model which includes two biological models as special cases. In detail, we study the qualitative behaviors (local and global stability, boundedness and periodicity character) of a general difference model.
